

New York State Species of Greatest Conservation Need

This is a *draft* list of *potential* Species of Greatest Conservation Need (SGCN) for the 2025 revision of New York's State Wildlife Action Plan (SWAP). Many of these species do not yet have a Species Status Assessment drafted. Many are still under review and may not be included in the final SWAP or they may be given a high priority designation.

To be included in the final SWAP, all SGCN must have a Species Status Assessment that describes the status and distribution of the species, the condition of its habitat, threats impacting the species, and proposed actions to mitigate the threats. Comments and information may be sent to nyswap2025@dec.ny.gov by January 14, 2025.

SGCN may be listed as special concern in New York, or not currently state listed. The status of these species may either be known, and they have an established breeding, wintering, or migratory population in New York; or the status may be poorly understood, but they are suspected to have a breeding, wintering, or migratory population in New York. These species may have experienced historic population declines that are now stabilizing or on a positive trajectory; they may be declining or beginning to experience declines in the state; or there are features of their life history that make them particularly vulnerable to threats. There are one or more identified threats to these species, and there is uncertainty regarding their long-term viability or persistence in New York. These species would either benefit from the implementation of conservation actions to maintain stable population levels or sustain recovery in New York; or research is needed to determine their actual status, trends, or specific management actions that could lead to maintenance of their populations in New York.
